

Developing Effective Active Transportation Projects and Programs

Support for Disadvantaged Communities

Module 10 Developing Active Transportation Plans

Local
Government
Commission

Overview

- Required Elements of a Plan
- Low-Cost Planning Solutions
- Planning Best Practices & Innovations
 - Measuring Active Transportation (Trips, Injuries)
 - Implementation Steps

Required Elements of a Plan

- See ATP Guidelines (page 10-11) for full list
- Major Elements:
 - Walk/Bike Mode Share
 - Maps of Walk/Bike Facilities, Collisions, & Land-Use Development Patterns
 - Maintenance Policies & Procedures for Walk/Bike Facilities
 - Description of Community Involvement in Plan Development
 - Implementation Steps & Public Reporting

Low-Cost Planning Solutions

- Develop a Pedestrian Safety Action Plan
- Conduct a series of workshops and walkability audits in your community with key stakeholders.
- Assemble plan based on community input and with simplified graphics and photos

In small communities it is possible to develop low-cost plans. One example is to work with the Pedestrian Safety Action Plan (PSAP) template developed several years ago by the Federal Highway Administration. Typically the PSAP is prepared through a facilitated 2- or 3-day process with local staff and representatives from the community (including advocates, persons with disabilities, seniors, etc.). They are led by two experts in pedestrian safety who work with the local representatives to fill out the template. At the end of that period local staff will have a draft plan that they can refine in a few weeks.

Low-Cost Planning Solutions

- Design Mini-Charrette can work well if dealing with a focused area (one street or corridor) or small town
- 2 to 3 days of walk audits, participatory workshops, etc.
 - Plan assembled with slides from final presentation
 - Notes for each slide describe recommendations, changes, process, etc.

11th Avenue — Proposed Cross Section

After: This drawing shows how the 58 feet of asphalt along 11th Avenue and the adjacent sidewalk and planting strip can be re-allocated to create a "complete street," a street that accommodates all users. As shown in this cross section, the new street would include 5-foot sidewalks on both sides of the street, a 5-foot planter strip for healthy tree growth, a 7-foot parking lane, a 6-foot bicycle lane (Class I) and one 10-foot lane in each direction. The 10-foot median could provide an excellent location for another row of trees. At intersections, the median gives way to a turning lane.

Example: Main Street Plan for Delano, CA

Another low-cost planning solution that can work well in a small town or when dealing with one street or corridor is to conduct a 2- to 3-day mini-charrette in which a design team works with local staff and community members through walk audits, participatory workshops, etc. to develop a plan in a short period of time.

Exercises that can be done during a half-day Walkable Community Workshop or a Mini-Charrette.

Planning Best Practices & Innovations

- Measuring Active Transportation (Trips, Injuries)
- Taking a Network Approach
- Wayfinding
- End-of-Trip Facilities
- Access to Transit
- Maintenance
- Implementation Steps

Measuring Active Transportation

- Measure Trips & Set goals
 - Existing number
 - Existing proportion
 - Future number and proportion
- Collisions, Serious Injuries & Fatalities
 - Absolute numbers
 - Proportion of all collisions
 - Goal for improvement

Establishing Goals: Mode Share

GOAL 1

Increase the number and types of bicyclists who bicycle in the City.

Support the goal of increasing bicycle activity by increasing access to public rights-of-way, by providing additional bicycle parking, by facilitating access to and amenities around transit, and by increasing programs and educational activities that encourage bicycling and diminish obstacles.

Equity: Street Access Objective 1.1.

Develop a comprehensive transportation and recreation bikeway system for the City of Los Angeles.

Policy 1.1.1

Establish bicycling as an officially designated mode of transportation in the State of California.

Program

Los Angeles Department Of City Planning

2010 BICYCLE PLAN

A COMPONENT OF THE CITY OF LOS ANGELES
TRANSPORTATION ELEMENT

Adopted March 1, 2011
Council File No. 10-2385-S2
CPC-2009-011-076

Examples of goals from different plans.

Establishing Goals: Safety

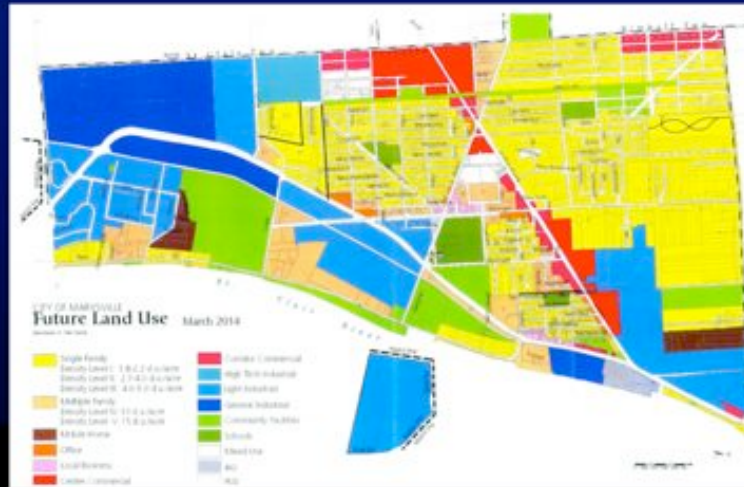

Goals

1. Reduce serious and fatal pedestrian injuries by 25% by 2016 and by 50% by 2021
2. Reduce inequities among neighborhoods in serious injuries to pedestrians
3. Increase walking and reduce short trips (< 1 mile) taken by car by 25% by 2021.
4. Provide high-quality walking environments

Measuring Active Transportation

- Include a Land Use Map

Taking a Network Approach

- Walk/Bike Network Maps
 - Existing and proposed walk/bike facilities including trails
 - Show safe routes to schools
 - Show safe routes to transit
 - Show low-stress network

Low Stress Bicycle Networks

Slides 13-26: Low-Stress Bicycle Networks

Bikes are allowed to ride on any street, and so your street network really goes everywhere, but... most people won't ride on every street, so this new classification system separates the streets by levels of traffic stress. You can see the stress level indicated by color on this map.

Scroll through to illustrate the various stress levels.

Low Stress Bicycle Networks

Level of traffic stress 1

Note the separation from traffic with LTS 1

Low Stress Bicycle Networks

Level of traffic stress 1

Low Stress Bicycle Networks

Level of traffic stress 1

Low Stress Bicycle Networks

Level of traffic stress 2

Note the single lane and wide bike lane for LTS 2

Low Stress Bicycle Networks

Level of traffic stress 3

Note the open car door ahead for LTS 3, and the bike lanes next to a busy, fast street

Low Stress Bicycle Networks

Level of traffic stress 3

Low Stress Bicycle Networks

Level of traffic stress 4

Note the bike lane disappearing at the intersection for LTS 4, or the total lack of bike lane

Low Stress Bicycle Networks

Level of traffic stress 4

Low Stress Bicycle Networks

Low Stress Bicycle Networks

As we drop out streets with higher level of stress we see the challenge in traveling outside small pockets of the City.

Low Stress Bicycle Networks

Low Stress Bicycle Networks

Wayfinding

- Best Practices
 - Direction
 - Destination
 - Distance
 - Design
- For pedestrians, provide an area map

Bicycle Wayfinding (Right Way)

Way-finding Signs

Any good sign has the 3 Ds: direction, destination, and distance that apply to both pedestrian and bicycle wayfinding

Pedestrian wayfinding also allows you to include an area map since people can spend more time reviewing it.

Bicycle Wayfinding (Right Way)

Bicycle Wayfinding (Wrong Way)

These signs from San Francisco use too much space for the route number, which most people don't pay attention to and don't provide useful information like destination and distance.

Bicycle Wayfinding (Wrong Way)

The result is that San Francisco has to use too many signs and they make for not very useful clutter.

Pedestrian Wayfinding

Pedestrian Wayfinding

End-of-Trip Facilities (Biking)

- Public, short-term, onstreet parking
 - Show map of needs and proposed bike racks to fill those needs
 - Specify racks to meet standards

End-of-Trip Facilities (Biking)

This is a graphic showing the best types of bicycle racks. There's one simple rule: two points of contact and the ability to use a U-lock to secure the bike. Simple racks are recommended.

End-of-Trip Facilities (Biking)

That doesn't mean that bike racks have to be simple. Here's a set of racks designed by the Talking Heads lead singer David Byrne who's now a bicycle advocate in New York City

End-of-Trip Facilities (Biking)

- Garages and parking lots
 - Public parking garages and lots
 - Private commercial garages and lots (existing and new)
 - Private residential parking garages and lots (existing and new)

End-of-Trip Facilities (Biking)

- Transit access parking
 - staffed & unstaffed
 - racks
 - inside paid-area parking
 - on-demand lockers
 - limited access parking

End-of-Trip Facilities (Biking)

- Transit access parking
 - staffed & unstaffed
 - racks
 - inside paid-area parking
 - on-demand lockers
 - limited access parking

End-of-Trip Facilities (Biking)

- Transit access parking
 - staffed & unstaffed
 - racks
 - inside paid-area parking
 - on-demand lockers
 - limited access parking

End-of-Trip Facilities (Biking)

- Transit access parking
 - staffed & unstaffed
 - racks
 - inside paid-area parking
 - on-demand lockers
 - limited access parking

End-of-Trip Facilities (Biking)

■ Festival parking

The right way (on left); the wrong way (on right).

Access to Transit

- Bike racks on buses
- Bikes on board vehicles
- Consider First Mile - Last Mile Connections
 - LA Metro First Last Mile Strategic Plan
 - TriMet Pedestrian Network Analysis Project (Portland OR)
 - VTA Pedestrian Access to Transit Plan (Santa Clara County)
- Other Issues?

Federal Transit Administration Bicycle/ Pedestrian Policy (76 FR 52046)

- FTA funds may be spent on:
 - Pedestrian improvements **within ½ mile of transit stop**
 - Bicycle improvements **within 3 miles**

Maintenance

Don't forget to maintain your trail. Poorly maintained trails are dangerous and can be a disincentive to riding or walking. Also, vegetation along the side of the road needs more aggressive trimming for bicycling than it does for driving.

Maintenance

http://safety.fhwa.dot.gov/ped_bike/tools_solve/fhwasa13037/fhwasa13037.pdf

Implementation

- Public Outreach
- Coordination with other plans and people
- Prioritizing Projects & Next Steps
- Funding
- Evaluation
- Approval

On the implementation side all of these elements need to be addressed through your plan.
